

Argus Interception delivers net interception drone to the Bundeswehr

Innovative technology protects armed forces and critical infrastructure

Rotenburg, 26 September 2025 – Argus Interception GmbH has delivered its net interception drone to the Bundeswehr (German armed forces). This is a demonstration of the company's expertise in the field of modern drone defence systems and consolidates its position as a reliable partner of the armed forces.

The net interception drone was developed specifically for safe, precise and controlled use against unmanned aircraft. Using innovative net interception technology, the system reliably intercepts uncooperative drones and brings them to the ground intact, preventing collateral damage and enabling secure recovery.

'With the delivery of our net interception drone to the Bundeswehr, we are making a significant contribution to the deployment and operational reliability of the armed forces,' explains Sven Steingraber, Managing Director and CSO of Argus Interception GmbH.

'Beyond its military relevance, our technology plays a key role in protecting critical infrastructure.'

Modern drone defence systems are becoming increasingly relevant in civilian security contexts. 'We are observing how critical infrastructure, especially airports, energy facilities and major event venues, are increasingly exposed to threats from unauthorised drone operations,' adds Steingraber. 'Argus Interception systems provide an effective, minimally invasive solution to reduce security risks and safeguard sensitive areas..'

As a German technology company, Argus Interception is committed to the highest quality standards, innovative development and reliability in both military and civilian applications.

About Argus Interception

ARGUS Interception GmbH is a leading German technology company and pioneer of net-based, minimally invasive C-UAS interception systems designed to safely capture and recover uncooperative drones. Founded in 2023 by former Bundeswehr (German armed forces) officers, the company develops and manufactures cutting-edge security-related technology in Germany for armed forces, authorities and operators of critical infrastructure. The ARGUS Interception® A1-Falke® net-based interceptor drone combines operationally proven net capture technology, proprietary software, and state-of-the-art sensor integration to enable responsible counter-drone operations without secondary damage from falling debris. The intact interception of uncooperative drones also enables forensic analysis experts to evaluate the drones' technical origin, deployment profile and potential attribution to specific actors or operational contexts.

ARGUS Interception enables governmental and institutional actors, as well as operators of critical infrastructure, to safeguard public security and maintain operational sovereignty.
